Combined Biota/Habitat Assessments removed as a cause on 8/14/2007 by R. Steed. I believe that the listing of Combined Biota/and Habitat Assessment was a mistake and results of more sophisticated water quality modeling demonstrate that the applicable WQS(s) is being met. . Stressor Identification suggested that sediment was a likely cause, and also suggested that there is a potential for metals contamination as well. IDEQ developed a Sediment budget in the Subbasin Assessment for the Rapid Lightning Creek watershed and found existing conditions to be approximately equal to target conditions. Rapid Lightning Creek is on the border of being impaired and additional land disturbance is likely to result in non attainment of the use. Implementation should focus on water quality improvements in the lower watershed. IDEQ has no specific metals data and presumes that temperature is the most likely cause of impairment if any.

Combinded Biota/Habitat Assessments removed as a cause on 8/14/2007 by R. Steed. McCormic Creek has large substrate with little to no fines. I believe that the listing of Combinded Biota/and Habitat Assessment was added by mistake and is a flaw in the original analysis of data and information led to the segment being incorrectly listed. Stressor Identification has identified low nutrients and insufficient reference conditions may be why McCormic Creek does not meet BURP standards.

2008 Integrated Report: Section 5 Impaired Waters

Fecal Coliform

Fivemile & Tenmile Creek Subbasin Assessment, page 37

The lower Boise River bacteria TMDL allocated a 95% reduction in fecal coliform concentrations in Fifteenmile Creek to meet bacteria standards in the river (50 CFU/100 ml). The fecal coliform geometric mean at the mouth was 992 CFU/100 ml. Reductions will also have to be made in Fivemile and Tenmile Creek to meet this target. Since the river TMDL was developed, the state of Idaho has moved to an E. Coli bacteria standard, which is a 30-day geometric mean of 126 organisms/100ml for both primary and secondary contact recreation.

Data collected in 1998 and 1999 at Fivemile and Tenmile Creek monitoring locations indicate that during the recreation season (May-August), both streams exceed the E.Coli standard at all locations (Table 8). The data are not represented as a monthly geometric mean, but clearly show that the recreation season concentrations are above the standard. Table 8. Bacteria concentrations in Fivemile and Tenmile Creek

2008 Integrated Report: Section 5 Impaired Waters

Cause Unknown

This segment of upper Boulder Creek is short and most of the degradation appears to be an artifact of historical grazing practices. There may not be enough natural energy and flow in this segment to provide a flushing effect for sediment deposition, as it originates from wetland seepage in relatively flat terrain. Although grazing still persists, little can be done in the way of management to restore or provide support for beneficial use (CWAL or SS). The segment immediately downstream is much longer and intermittent, thus this upper portion is relatively isolated from the main Boulder Creek system most of the time. TMDL establishment is probably inappropriate as the perennial, channelized portion of this segment is approximately 1/4 mile in length.
